Creating a Floor Plan with Colors and Patterns

The information in this article applies to:

**QUESTION**

I would like to create a colored floor plan of my structure. What are the methods available for accomplishing this task?

**ANSWER**

There are several ways to create a colored floor plan in Home Designer Pro that we will discuss in this article, including:

- Colored Fill Patterns and Line Styles
- Rendered Image Floor Plans
- Vector Image Floor Plans

**Colored Fill Patterns and Line Styles**

To be able to have a colored floor plan where the openings are easy to view and where you can use the Text tools directly to annotate and view the Room Types; simply change the colors you currently have assigned for the various items in your 2D floor plan view.
To set the color or pattern of rooms

1. Using the Select Objects tool to click in a room to select it, then choose the Open Object edit tool to display the Room Specification dialog.

2. Go to the Fill Style panel and use the Type drop-down menu to select a Fill Pattern.

3. Next, set the Spacing, Angle, Line Weight, Color, and other properties associated with the Fill Pattern.
4. Once you have finished making your changes, click **OK** to apply them to the floor plan and close the dialog.

Depending on the color that you have chosen for your room, you may notice the room label and other objects blend with the room color.

Home Designer Pro gives you the ability to change the background color for your room labels, and the Chief Architect Premier (https://www.chiefarchitect.com/products/premier/) version of the software also allows you to set a fill color for other objects such as cabinets, furniture, fixtures, appliances, etc.

To change the background color for your room labels

1. Use the **Select Objects** tool to select the text of the Room Label and choose the **Open Object** edit tool to display the **Room Label Specification** dialog.

2. On the **Fill Style** panel, select the **Solid** option from the **Type** drop-down, and then
click on the **Color** box to specify the background you want for this room label.

Black text with a white fill style was used in our example.

If you want to be able to change the actual text of a Room Label (such as from Bedroom to Child’s Bedroom), you can open the Room Specification dialog and type in what you want in the Room Name field on the General panel.

3. Repeat this process until all of the room labels backgrounds have been updated.

In some cases, we may want to change the color, or line style, that is applied to an object in our 2D floor plan view. For example, electrical objects display as a bright red, and we may want to change their outline to black instead.

To change the line color

1. Select **Tools>Display Options**.

2. Scroll down to the layer that you want to change, such as the **Electrical** layer, and then click on the **Color** box associated with the layer to change it.
3. Note that you can also change the line style, so if we wanted to have a dashed line instead of a continuous one, we would change this here for that layer as well.

4. The **Layer Display Options** dialog is also where we can turn off the display of certain objects.

   For example, if we did not want to see any of the invisible walls used to separate out sections of the plan, we could scroll down to **Walls, Invisible** and remove the check from the **Disp** column.

5. Once you have finished making changes in this dialog, click **OK** to apply them to your 2D floor plan view.
To create a rendered floor plan

1. First, launch Home Designer Pro and choose to Open the plan in which you would like to create a rendered floor plan view.

2. Once the file is open, select 3D > Create Orthographic View > Orthographic Doll House View.

4. With the camera view still active, select 3D > Edit Active Camera and in the specification dialog that appears:
- Set whether or not you want shadows to display by selecting or deselecting the Show Shadows box.

- Check the Edge Smoothing when Idle box to smooth out the edges on the design.

- If you don't want the backdrop image to be displayed, select the Remove Backdrop button located on the BACKDROP panel.

- Select OK to confirm the changes.

5. If you'd like to see the Terrain Perimeter in the view, navigate to Tools> Display Options and put a check in the Disp column next to the Terrain Perimeter display layer.

6. Once all changes have been made, select 3D> View Direction> Top View.

7. The view can now be exported by selecting File> Export> Export Picture. Give the file a name and specify a location to save the image to.

If you would like to be able to add text to your rendered floor plan, such as to add Room Name labels, you can choose to re-import the exported picture file into a new, blank floor plan by navigating to File> Import> Import Picture and browsing for the exported image.
While this option of a rendered floor plan provides the most realistic looking results, you will notice that it can be difficult to tell where door and window openings are located, unless you use the **Cross Section Slider** tool and adjust the position such that the walls above the door and window openings get cut off, as in the example below. To access the Cross Section Slider tool, navigate to **3D > Camera View Options > Cross Section Slider**.

Vector Image Floor Plans

Your second option for creating a colored floor plan is to use the Vector rendering technique, instead of the Standard one.
To create vector floor plan

1. First, launch Home Designer Pro and choose to Open the plan in which you would like to create a rendered floor plan view.

2. Once the file is open, select 3D> Create Orthographic View> Orthographic Doll House View.

3. With the camera view still active, select 3D> Edit Active Camera and in the specification dialog that appears:
• Set whether or not you want shadows to display by selecting or deselecting the **Show Shadows** box.

• Check the **Edge Smoothing when Idle** box to smooth out the edges on the design.

• If you would like a backdrop image to be displayed, select the backdrop of your choice on the **BACKDROP** panel.

• Select **OK** to confirm the changes.

**Note:** If the backdrop that was chosen is not being displayed, navigate to 3D> Rendering Techniques> Technique Options to open the Rendering Technique Options dialog, select the Vector View panel, place a check in the Use Backdrop box, then hit OK.

4. If you'd like to see the Terrain Perimeter in the view, navigate to **Tools> Display Options** and put a check in the **Disp** column next to the **Terrain Perimeter** display layer.

5. Next, select **3D> View Direction> Top View**.

6. The view can now be exported by selecting **File> Export> Export Picture**. Give the file a name and specify a location to save the image to.
If you would like to be able to add text to your rendered floor plan, such as to add Room Name labels, you can choose to re-import the exported picture file into a new, blank floor plan by navigating to File> Import> Import Picture and browsing for the exported image.

While this option provides the clean line drawing look for the results, you will notice that it can still be difficult to tell where door and window openings are located.
