The information in this article applies to:

QUESTION

How do I add a beam to my plan in Home Designer Pro?

ANSWER

Floor, ceiling, and roof beams can be created with the framing tools.

Creating a floor, ceiling, or roof beam

1. From the menu, select **Build> Framing> Roof Beam**  or **Build> Framing> Floor/Ceiling Beam** , depending on the type of beam that you want to create.
 2. Once you have selected the appropriate menu item, your mouse pointer will turn into a small cross and you will be able to click and drag in plan view to create the beam.
-

The beams that you create in Home Designer Pro using this method will be visible in plan view, but may need to have the display of Framing in Display Options turned on to be visible in 3D camera views
